Effective Techniques for Understanding and Improving Data Structure Usage Changhee Jung,2013 Turing Award winner Niklaus Wirth famously noted Algorithms Data Structures Programs and it follows that data structures should be carefully considered for effective application

development In fact data structures are the main focus of program understanding performance engineering bug detection and security enhancement etc Our research is aimed at providing effective techniques for analyzing and improving data structure usage in fundamentally new approaches First detecting data structures identifying what data structures are used within an application is a critical step toward application understanding and performance engineering Second selecting efficient data structures analyzing data structures behavior can recognize improper use of data structures and suggest alternative data structures better suited for the current situation where the application runs Third detecting memory leaks for data structures tracking data accesses with little overhead and their careful analysis can enable practical and accurate memory leak detection Finally offloading time consuming data structure operations By leveraging a dedicated helper thread that executes the operations on the behalf of the application thread we can improve the overall performance of the application

Advanced Theories and Computational Approaches to the Electronic Structure of Molecules C.E. Dykstra,2012-12-06 That there have been remarkable advances in the field of molecular electronic structure during the last decade is clear not only to those working in the field but also to anyone else who has used quantum chemical results to guide their own investigations The progress in calculating the electronic structures of molecules has occurred through the truly ingenious theoretical and methodological developments that have made computationally tractable the underlying physics of electron distributions around a collection of nuclei At the same time there has been considerable benefit from the great advances in computer technology The growing sophistication declining costs and increasing accessibility of computers have let theorists apply their methods to problems in virtually all areas of molecular science Consequently each year witnesses calculations on larger molecules than in the year before and calculations with greater accuracy and more complete information on molecular properties We can surely anticipate continued methodological developments of real consequence and we can also see that the advance in computational capability is not about to slow down The recent introduction of array processors multiple processors and vector machines has yielded a tremendous acceleration of many types of computation including operations typically performed in quantum chemical studies Utilizing such new computing power to the utmost has required some new ideas and some reformulations of existing methods
