

# PowerPC™

## Application Note PowerPC Microprocessor Clock Modes

The PowerPC™ microprocessors offer customers numerous clocking options. An internal phase-lock loop synchronizes the processor (CPU) clock to the bus or system clock (SYSCLK) at various ratios. These ratios allow the designer to utilize the following options:

- Low-speed, low-cost memory systems with economical, low-cost processors.
- Low-speed, economical memory systems isolated from very high-speed processor cores and internal cache.
- High-speed, performance oriented memory systems with maximum achievable processor core and internal cache frequencies.
- Embedded systems with unusual bus speeds dictated by system requirements other than the processor.

This document is divided into two parts:

- General information—This section discusses a variety of issues including:
  - PowerPC microprocessor clocking operation
  - PowerPC device numbering methodology
  - Various test issues and methodology
  - Special timing considerations
- Appendixes—This section provides several graphs of PowerPC microprocessor clock relationships.
