**Saturating Servomechanism to Follow a Random Process** Pierre Govaerts,1961 Solutions to the problem of obtaining the optimal bounded input to a servomechanism which must follow a discrete time random process are given in the case of a first order system If the random process is a finite Markov chain solutions can be obtained for any servomechanism with finite state vector with each component having only a finite range The cost function is any function of the state and of the control which is restricted to a finite set of values The generalizations of these problems can be done in various directions Keeping the assumptions of a discrete time random process  $x_t$  and the form of the cost functional which both make sense in engineering applications a first extension would be to consider servomechanisms of order greater than one in the cases of independent and of Markov dependent random variables As a further extension the cost functional could include a function of the control itself instead of depending only on the error In the finite case when the inputs and the servomechanism take values in finite sets only the problem is theoretically solved by application of the minimization procedure in a product space of sufficiently high dimensions However this becomes rapidly numerically unworkable as the number of variables increases How to reduce the dimensionality of the problem is then worth a careful investigation Author
