Computer Generated Physical Properties Stan Bumble, 1999-06-01 *Computer Generated Physical Properties* offers the environmental scientist a basis to predict the properties of molecules and reengineer them to remove those properties that are harmful to the environment. This technology is currently used in other fields and is now becoming popular in the environmental engineering field because of its pollution prevention and waste reduction capabilities. This book is interdisciplinary in scope, treating the physical properties of matter as generated by computers. It covers a wide variety of topics, pointing towards synthesizing new molecules to substitute for reactants, intermediaries, and products in industrial processes with better physical and environmental properties than the original. The author achieves this with a spreadsheet program called SYNPROPS that operates on a PC computer with optimization features. A radar-type graph, one for each property, visually sorts the various groups in order of their contribution to the property, creating the necessity for a computer to obtain answers for the structure of the optimum molecules for substitution or synthesis. The author discusses applications to biologically active molecules without side effects, including antineoplastic drugs. Additionally, he demonstrates model compounds and the applications of SYNPROPS optimization and substitution. This book has everything you need to know about deriving properties and combinational chemistry from molecular structure.

Gas-Phase Combustion Chemistry W.C., Jr. Gardiner, 1999-12-10 Superseding Gardiner's *Combustion Chemistry*, this is an updated comprehensive coverage of those aspects of combustion chemistry relevant to gas-phase combustion of hydrocarbons. The book includes an extended discussion of air pollutant chemistry and aspects of combustion and reviews elementary reactions of nitrogen, sulfur, and chlorine compounds that are relevant to combustion. Methods of combustion modeling and rate coefficient estimation are presented, as well as access to databases for combustion thermochemistry and modeling.

CHEMKIN-III: A FORTRAN Chemical Kinetics Package for the Analysis of Gas-phase Chemical and Plasma Kinetics, 2001 This document is the user's manual for the third generation CHEMKIN package. CHEMKIN is a software package whose purpose is to facilitate the formulation and interpretation of problems involving elementary gas-phase chemical kinetics. It provides a flexible and powerful tool for incorporating complex chemical kinetics into simulations of fluid dynamics. The package consists of two major software components: an Interpreter and a Gas Phase Subroutine Library. The Interpreter is a program that reads a symbolic description of an elementary user-specified chemical reaction mechanism. One output from the Interpreter is a data file that forms a link to the Gas Phase Subroutine Library. This library is a collection of about 100 highly modular FORTRAN subroutines that may be called to return information on equations of state, thermodynamic properties, and chemical production rates. CHEMKIN III includes capabilities for treating multi-fluid plasma systems that are

not in thermal equilibrium These new capabilities allow researchers to describe chemistry systems that are characterized by more than one temperature in which reactions may depend on temperatures associated with different species i e reactions may be driven by collisions with electrons ions or charge neutral species These new features have been implemented in such a way as to require little or no changes to CHEMKIN implementation for systems in thermal equilibrium where all species share the same gas temperature CHEMKIN III now has the capability to handle weakly ionized plasma chemistry especially for application related to advanced semiconductor processing [SURFACE CHEMKIN-III](#) ,1996 This document is the users manual for the SURFACE CHEMKIN III package Together with CHEMKIN III this software facilitates the formation solution and interpretation of problems involving elementary heterogeneous and gas phase chemical kinetics in the presence of a solid surface The package consists of two major software components an Interpreter and a Surface Subroutine Library The Interpreter is a program that reads a symbolic description of a user specified chemical reaction mechanism One output from the Interpreter is a data file that forms a link to the Surface Subroutine Library which is a collection of about seventy modular Fortran subroutines that may be called from a users application code to return information on chemical production rates and thermodynamic properties This version of SURFACE CHEMKIN III includes many modifications to allow treatment of multi fluid plasma systems for example modeling the reactions of highly energetic ionic species with a surface Optional rate expressions allow reaction rates to depend upon ion energy rather than a single thermodynamic temperature In addition subroutines treat temperature as an array allowing an application code to define a different temperature for each species This version of SURFACE CHEMKIN III allows use of real non integer stoichiometric coefficients the reaction order with respect to species concentrations can also be specified independent of the reactions stoichiometric coefficients Several different reaction mechanisms can be specified in the Interpreter input file through the new construct of multiple materials
