## Recent Work in the Prescience Lab

### Virtualization (v3vee.org)

#### Palace

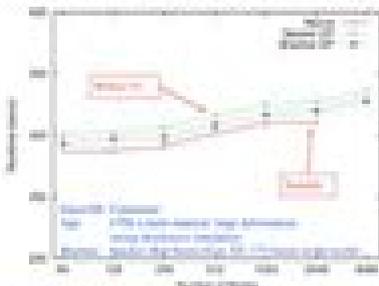

An OS Independent Environment & VM

A new, publicly available, open source virtual machine monitor for modern x86 architectures that runs on Citrix X7 supercomputers, clusters (Intel and AMD), servers, desktops, etc.

Palace is intended to support research in high performance computing and computer architecture, in addition to systems. It can be easily embedded into other OSes.

Palace, when embedded in a lightweight kernel, such as Sandia National Lab's Kiva, runs a compact, type-1 para-VMs suitable for virtualizing a supercomputer at scale with minimal overhead even when running tightly coupled, communication-intensive parallel applications on MPC OEs.

### Older Work: Versatile, Adaptive Virtual Computing

- Provides self-organizing and communication flexibility
- Uses two collections of virtual machines (VMs) that are interconnected by overlay networks
- Replacement for buying machines
- That continuously adapts... to increase the performance of your existing, unmodified applications and operating systems

**Virtualization flexibility:** The application's own ability to dynamically and cheaply address a core of the application's resources and VMs, demands self-organizing and parallel task allocation.

**Performance flexibility:** The application's own ability to dynamically and cheaply address a core of the application's resources and VMs, demands self-organizing and parallel task allocation.

**Resource management flexibility:** The application's own ability to dynamically and cheaply address a core of the application's resources and VMs, demands self-organizing and parallel task allocation.

**Adaptability:** The application's own ability to dynamically and cheaply address a core of the application's resources and VMs, demands self-organizing and parallel task allocation.

**Scalability:** The application's own ability to dynamically and cheaply address a core of the application's resources and VMs, demands self-organizing and parallel task allocation.

**Flexibility:** The application's own ability to dynamically and cheaply address a core of the application's resources and VMs, demands self-organizing and parallel task allocation.

### Empathic Systems (empathicsystems.org) Experimental Computer Systems Researchers Should...

- Incorporate user studies into the evaluation of systems
  - No such thing as the typical user
  - Variation in user satisfaction with given operating point is large
- Incorporate direct user feedback into the design of systems
  - No such thing as the typical user
  - Measure and leverage that high user variation

### We Have Applied This Idea Extensively and Successfully

- **Real-time scheduling of intensive virtual machines allows even better users to trade off between cost and interactive performance:** via a simple trade interface.
- **Expansive dynamic voltage and frequency scaling exploits user feedback to lower power consumption in a laptop computer by consistently 20% while maintaining high user satisfaction.**
  - EMTS user power factor when needed: 20% better than Windows DPM
  - EMTS maintains rate of active running changes: 10 FPS better
  - EMTS allowed an eight-fold hardware decrease in per-user capabilities: 20% better
  - EMTS maintains lower satisfaction: 17% better
- **Operative remote display projects and shows remote user content on the client, prioritizing network latency effects.** Three users can trade off between display compression and responsiveness.
- **Empathic network link scheduling provides user satisfaction-driven control over scheduling for bandwidth-constrained links in home networks.** It increases overall user satisfaction by 14% over an RSVP link, and by 30% compared to a naive RSVP link.
- **User-generated dynamic display power management controls laptop LCD backlight based on power determined by alternative user or secondary feedback.**

### We Are Now Studying Techniques for Free, Biometric-Based, Continuous Measurement of User Satisfaction

Software-free systems that measure, predict, and respond, apply biometric-based methods to the design of user interfaces. Some have also been demonstrated in other user interface environments.

### Sensors (absynth-project.org)

Wireless sensor network applications are extremely challenging for domain scientists to implement.

Success typically requires either collaboration with a "CS-side" sensor networking researcher or with an expensive embedded systems engineer.

However, many prospective applications are either conceptually simple or fit into one of a small number of classes.

We design, implement, and evaluate (through carefully controlled user studies) programming languages and systems specifically for domain scientists and other non-experts.

### Archetype-based Design

- Study of the literature for deployed applications suggests about 40% of the sensor network classes.
- Proposed: describe an "archetype language" for each class combined with an generic template for "archetype" or "real" language. The user customizes about their general application or task or an archetype. We measure the performance for the specific program. The system synthesizes a hardware/software design.
- Archetype languages are designed for domain scientists. They are also extremely high-level, allowing expression of the archetype in a page of code, user-facing the trade-off of the synthesis and compilation overheads.

Language	Learning time	Design time (avg)
Proposed language for non-archetype	10, 10, 10, 10, 10, 10	10, 10, 10, 10, 10, 10
Proposed language for high-archetype	10, 10, 10, 10, 10, 10	10, 10, 10, 10, 10, 10
Proposed language for low-archetype	10, 10, 10, 10, 10, 10	10, 10, 10, 10, 10, 10
Proposed language for high-archetype	10, 10, 10, 10, 10, 10	10, 10, 10, 10, 10, 10
Proposed language for low-archetype	10, 10, 10, 10, 10, 10	10, 10, 10, 10, 10, 10
Proposed language for high-archetype	10, 10, 10, 10, 10, 10	10, 10, 10, 10, 10, 10
Proposed language for low-archetype	10, 10, 10, 10, 10, 10	10, 10, 10, 10, 10, 10

### A BARK Approach

- The BARK programming language proved to be a great success in getting naive users (children to naive college programs) to construct meaningful embedded systems (the synthesis of these systems is the early "BARK").
- We have developed an BARK for use in sensor networks. The language is extended with sensor network concepts needed for writing small-scale programs, and these concepts are presented via user study around common tasks for the scientific user programmer.
- Depending on the task, 61-75% of subjects with no prior programming experience can write simple, power-efficient, and robust sensor network programs after a 10 minute tutorial. 61-68% of those finished in typical domain scientist experience can do so.
