Fuel Cells: Technologies for Fuel Processing Dushyant Shekhawat, J.J. Spivey, David A Berry, 2016-08-19 Fuel Cells Technologies for Fuel Processing provides an overview of the most important aspects of fuel reforming to the generally interested reader researcher technologist teacher student or engineer The topics covered include all aspects of fuel reforming fundamental chemistry different modes of reforming catalysts catalyst deactivation fuel desulfurization reaction engineering novel reforming concepts thermodynamics heat and mass transfer issues system design and recent research and development While no attempt is made to describe the fuel cell itself there is sufficient description of the fuel cell to show how it affects the fuel reformer By focusing on the fundamentals this book aims to be a source of information now and in the future By avoiding time sensitive information analysis e.g economics it serves as a single source of information for scientists and engineers in fuel processing technology The material is presented in such a way that this book will serve as a reference for graduate level courses fuel cell developers and fuel cell researchers

Fuels Processing for Transportation Fuel Cell Systems, 1995 Fuel cells primarily use hydrogen as the fuel This hydrogen must be produced from other fuels such as natural gas or methanol The

fuel processor requirements are affected by the fuel to be converted the type of fuel cell to be supplied and the fuel cell application The conventional fuel processing technology has been reexamined to determine how it must be adapted for use in demanding applications such as transportation The two major fuel conversion processes are steam reforming and partial oxidation reforming The former is established practice for stationary applications the latter offers certain advantages for mobile systems and is presently in various stages of development This paper discusses these fuel processing technologies and the more recent developments for fuel cell systems used in transportation The need for new materials in fuels processing particularly in the area of reforming catalysis and hydrogen purification is discussed **Fuel Processing for Fuel Cells** J.

A. S. Bett, M. C. Cutlip, P. F. Foley, 1981 In present fuel cell power plants the fuel processor is a catalytic steam reformer which is limited to the use of fuels such as naphtha and natural gas The sulfur content of these feeds must be reduced to low levels by hydrotreatment before contacting the nickel catalyst in the reformer However future fuel cell power plants may be required to use coal derived liquid fuel or heavy petroleum distillates which are more difficult to hydrotreat and reform To meet this requirement an adiabatic steam reformer is being developed by United Technologies Corporation with the support of the Electric Power Research Institute In the adiabatic reformer air is added to the process stream to provide by combustion the heat for endothermic reforming in a catalyst bed In the inlet section of the reformer air and fuel combust and reforming is initiated on special catalysts whose primary function is to prevent formation and accumulation of carbon Following the inlet section catalysts with high activity for steam reforming complete the conversion of the remaining fuel principally methane The objective of the present program is to establish a reactor model for the adiabatic reformer which would predict process stream compositions and temperatures and include carbon formation processes Progress is reported on the four tasks 1 determine rate expressions for catalytic reactions occurring in the adiabatic reformer 2 establish a reactor model to predict process stream compositions in the adiabatic reformer using data from Task 1 for catalytic reactions and data from the literature for homogeneous gas phase reactions 3 determine critical conditions for carbon formation on selected catalysts using microbalance experiments and 4 establish a model to predict carbon formation by combination of the model for process stream composition from Task 2 and data for carbon formation from Task 3 **Fuel Cells for the 21st Century**, 1999
